NTG-4A PCB Depanelizing Machine

*Over 30 Years of
Commitment
to Innovation.*

Hi-Tech would like to introduce you to the newly purchased NTG-4A PCB Depanelizer.

Since Hi-Tech was opened over 30 years ago we make it our part to keep our machinery updated to today's latest technology.

Economical production of PCBs in panel form has often put at risk at the separation stage by the "breaking" method because components and strip conductors are often damaged.

In order to reduce bending tension during PCB separation the motorized NTG-4A depanelizer cuts prescored panels by means of two round knives. With this two knife technology you can separate PCBs that have traces and components right up to the scoring lines. Both knives and guiding blades can be continuously adjusted for PCB thickness.

The NTG-4A enables the depaneling of PCBs which are assembled with components up to 2" in height and 16" square.

The variable speed and ergonomic construction of the machine enables a high output rate.

Innovation and investment keeps Hi-Tech at the cutting edge of technology and helps maintain our position as an industry leader.
